Paravalvular Leak: Diagnosis and Percutaneous Treatment

- * Paravalvular Leak (PVL) is an abnormal communication between cardiac chambers separated by a prosthetic valve through a gap along the valvular strut
- * It has been reported in 2-17% of surgical AV replacement procedures and in 2.2-22% of MV replacement procedures
- * It occurs in 2/3 of cases in the first year after surgery (due to anatomic or technical problems) and later in the remaining cases (due to endocarditis or prosthesis dehiscence)

Centro Congressi
Auditorium San Francesco

Paravalvular Leak: Diagnosis and Percutaneous Treatment

- * Predisposing risk factors are tissue friability, annular calcification and infection
- * Corticosteroid therapy and previous surgical valve replacements increase the risk of PVL formation
- * Clinical relevant PVLs occur in 2-5% of patients
- * Main indications for treatment are symptomatic hemolytic anemia, congestive heart failure or both
- * Clinical PVLs have relevant impact in long-term prognosis

Lucca,
22-24 Giugno
2023

Centro Congressi
Auditorium San Francesco

Paravalvular Leak: Diagnosis and Percutaneous Treatment

- * PVL has been reported up to 10-25% of pts submitted to TAVI with the first generation valves and up to 2-5% of cases with the latest generation valves
- * Aortic annulus calcification volume and use of self-expanding valves (vs balloon-expanding ones) are risk factors for PVL formation
- * Clinical significant PVL is an independent risk factor for early (<30 day) and late mortality after TAVI

Paravalvular Leak: Diagnosis and Percutaneous Treatment

PVL Treatment

- **Surgery**
- **Trans-catheter**
- **"Hybrid" approach**

17° Meeting

CardioLucca
Heart Brings Heart **2023**

Lucca,
22-24 Giugno
2023

Centro Congressi
Auditorium San Francesco

Paravalvular Leak: Diagnosis and Percutaneous Treatment

Percutaneous vs surgical approach

* The occluding device fills the gap by a “stenting” mechanism different from the stitch traction of fragile peri-valvular tissues as in surgical approach

Lucca,
22-24 Giugno
2023

Centro Congressi
Auditorium San Francesco

Paravalvular Leak: Diagnosis and Percutaneous Treatment

*** Based on the number of re-interventions, surgical treatment shows increasing morbidity (recurrence of PVL from 15% after 1st re-do to 35% after 3rd re-do) and mortality (from 13% after 1st re-do to 37% after 3rd re-intervention)**

Paravalvular Leak: Diagnosis and Percutaneous Treatment

Indication to percutaneous treatment

- * **Hemodynamic and clinical relevance !!!!**
- * **Surgical indication**
 - "compassionate" in high-risk pts
 - "alternative" to surgery
- * "Predicted" surgical indication in significant PVL without clinical relevance (early phase)

17° Meeting

CardioLucca

Paravalvular Leak: Diagnosis and Percutaneous Treatment

Mitral PVL

- Often echocardiographically-guided without angiography
- More challenging to occlude and with a higher failure rate

Aortic PVL

- Often angiographically-guided (echocardiography useful in biological prosthesis without cage and radio-opaque markers)
- Less difficult and risky to approach
- Higher success rate

17° Meeting

Paravalvular Leak: Diagnosis and Percutaneous Treatment

Results—308 PVL closure procedures were attempted in 259 patients in 20 centers (2004-2015). Patient age was 67 ± 13 years; 28% were female. The main indications for closure were heart failure (80%) and hemolysis (16%). Devices were successfully implanted in 91% of patients, via radial (7%), femoral arterial (52%), femoral venous (33%) and apical (7%) approaches. 19% of patients required repeat procedures. The target valve was mitral (44%), aortic (48%), both (2%), pulmonic (0.4%) or TAVR (5%). Pre-procedural leak was severe (61%), moderate (34%) or mild (5.7%) and was multiple in 37%. PVL improved post-procedure ($p < 0.001$) and was none (33.3%), mild (41.4%), moderate (18.6%) or severe (6.7%) at last follow up. Mean NYHA improved from 2.7 ± 0.8 pre-procedure to 1.6 ± 0.8 ($p < 0.001$) after a median follow-up of 110 [7-452] days. Hospital mortality was 2.9% (elective), 6.8% (in-hospital urgent) and 50% (emergency), ($p < 0.001$). MACE during follow-up included death (16%), valve surgery (6%), late device embolization (0.4%) and new hemolysis requiring transfusion (1.6%). Mitral PVL was associated with higher MACE (HR=1.83, $p=0.011$). Factors independently associated with death were the degree of persisting leak (HR=2.87, $p=0.037$), NYHA (HR=2.00, $p=0.015$) at follow up and baseline creatinine (HR=8.19, $p=0.001$). The only factor independently associated with MACE was the degree of persisting leak at follow up (HR=3.01, $p=0.002$).

Outcomes and predictors of success and complications for paravalvular leak closure: an analysis of the Spanish real-world paravalvular LEaks closure (HOLE) registry

Jose Francisco Diaz¹⁹, MD; Ignacio Cruz-Gonzalez^{20*}, MD, PhD

Eulogio Garcia¹, MD; Dabit Arzamendi², MD, PhD; Pilar Jimenez-Quevedo³, MD, PhD; Fernando Sarnago⁴, MD; Gerard Marti⁵, MD; Angel Sanchez-Recalde⁶, MD; Garikoit Lasa-Larraya⁷, MD; Manuel Sancho⁸, MD, PhD; Andres Iñiguez⁹, MD, PhD; Javier Goicolea¹⁰, MD; Koldobika Garcia-San Roman¹¹, MD; Juan Horacio Alonso-Briales¹², MD; Eduardo Molina¹³, MD; Jose Calabuig¹⁴, MD; Xavier Freixa¹⁵, MD;

Alberto Berenguer¹⁶, MD, FESC; Mariano Valdes-Chavarrri¹⁷, MD, PhD; Nicolas Vazquez¹⁸, MD;

EuroIntervention 2017;12:1962-1968

Methods and results: A total of 514 first-attempt percutaneous PVL closure in 469 patients were included at 19 centres. Technical and procedural success was achieved in 86.6% and 73.2% of the patients, respectively. In multivariate analysis, the independent predictors for procedural success in mitral lesions were the type of device used (AMPLATZER AVP III vs. others, HR 2.68 [1.29-5.54], p=0.008) and the number of procedures performed at the centre (top quartile vs. others, HR 1.93 [1.051-3.53], p=0.03). For aortic leaks the only predictor of procedural success was the leak size (≥ 10 mm vs. < 10 mm, HR 3.077 [1.13-8.33], p=0.027). The overall major adverse events rate (death or emergency surgery or stroke) at 30 days was 5.6%; the only predictor for combined adverse events was New York Heart Association functional Class IV (HR 4.2 [1.42-12.34], p=0.009).

Paravalvular Leak: Diagnosis and Percutaneous Treatment

Conclusions

- Transcatheter treatment of PVLs is a complex but highly effective approach at lower risk than surgical re-do
- Clinical outcome is often better than technical and instrumental results
- Tight cooperation between “imaging” cardiologist, invasive cardiologist, anesthesiologists and cardiac surgeons is crucial to achieve effective closure

Paravalvular Leak: Diagnosis and Percutaneous Treatment

- Knowledge of local anatomy, the use of dedicated and “off-label devices and some sort of “imagination” are crucial for the final success of the procedure
